FOR PREPARING THEM FROM FOOD

GUMS

INFORMATION DISCLOSURE STATEMENT PURSUANT TO 37 C.F.R. 1.97

Commissioner of Patents and Trademarks Washington, D. C. 20231

SIR:

Takahashi, H., Dietary Fiber From Guar Plant Seed, Technical Bulletin,
Taiyo Kagaku Company, Limited, March, 1990, ('Takahashi') discloses a product
called 'Sunfiber' which is a purified low molecular weight guar gum which has
been digested with a beta-D-mannanase produced by Aspergillius niger.

Takahashi discloses that Sunfiber has a molecular weight from 24,000 to 30,000,
and has beneficial physiological effects in the human diet, including reduced
serum lipid levels, reduced gastrointestinal transit time, reduced serum
cholesterol, and improved glucose tolerance. Takahashi also discloses certain
functional characteristics of the Sunfiber product, including its use as a
dietary fiber, a film former, a foam stabilizer, a swelling agent, a syneresis
inhibitor, and a colloid protector. Takahashi does not disclose the use of
this product as a bulking agent. Further, Takahashi does not teach that the
guar gum may be enzymatically degraded to an average DP of 3 to 75, nor that
such a highly degraded guar gum has beneficial functional properties as a sugar
replacement.

European Patent Application No. 0,301,440 of Barnett, et al., published February 1, 1989 ("Barnett") discloses water soluble bulking agents comprising modified and unmodified hemicelluloses, which may serve to replace the functional properties of carbohydrates or fats in food formulations. Barnett discloses that the hemicelluloses may be modified by treatment with acid or enzyme to break down the polysaccharide to lower molecular weights, including oligosaccharides composed of only 4 to 10 sugar units. Barnett discloses that hemicellulose A may be treated with a xylanase or cellulase to degrade the hemicellulose to the desired degree. Also disclosed is the degradation of hemicellulose B with an enzyme preparation containing hemicellulase and

cellulase. Barnett does not disclose that bulking agents may be prepared from the food gums, such as the glactomannans and xanthan gum employed by Applicants herein. Further, Barnett does not disclose that the depolymerization process is necessary to the production of a functionally suitable bulking agent.

Finally, Barnett's invention is directed to the use of nonwoody lignocellulosic substrates such as corn bran, alfalfa hay, oat bran, citrus pulp, peanut shells and soy bean stover, having a pentose polymer backbone.

European Patent Application No. 0,251,798 of Jensen, et al., published January 7, 1988 ('Jensen') and its U.S. equivalent: U.S. Pat. No. 4,871,571, issued October 3, 1989, to Jensen, et al., discloses low calorie bulking agents comprising a glucose oligomer(s), having a DP of 3 or 4 and one beta-1;3-glucosidic bond, the balance of the other bonds being 1,4 bonds. Jensen teaches that these bulking agents may be produced by the hydrolysis of beta-glucan. The process comprises grinding barley, liquification and saccharification with enzymes, termamy1^m and amyloglucosidase. This is followed by further separation steps and hydrolysis with a beta-glucanase which is then inactivated prior to isolation of the bulking agent. In contrast with Applicant's invention, these agents, and the material from which they are derived, are not heteropolysaccharides.

Patent Cooperation Treaty Application No. WO 89/04609, of Singer, et al., published June 1, 1989, discloses a bulking agent comprising cellobiitol which may be used in combination with a high potency sweetener to provide the functional characteristics of sucrose in formulated foods without high caloric content. Unlike Applicant's invention, this bulking agent is chemically produced and comprises a disaccharide of glucose and sorbitol.

The following U.S. patents disclose bulking agents which may be employed in food formulations:

```
4,376,198, issued March 8, 1983, to Divivedi, et al. 4,024,290, issued May 17, 1977, to Layton 4,526,794, issued July 2, 1985, to Altomare, et al. 3,766,165, issued May 25, 1972, to Rennhard, and 4,451,489, issued May 29, 1984, to Beale, et al.
```

None of these patents disclose the depolymerization of naturally-occurring gums to provide bulking agents suitable for use in reduced calorie edible formulations.

The following U.S. patents disclose high potency or low calorie sweeteners which may also be employed as bulking agents in foods:

4,459,316, issued July 10, 1984, to Bakal 4,786,722, issued November 22, 1988, to Sehner

Neither of these patents disclose the bulking agents claimed by Applicants herein.

Tamrind Seed Polysaccharide: Glyloid: Thickening Stabilizing and Gelling Agent, Technical Bulletin, Dainippon Pharmaceutical Company, Inc., Osaka, Japan (1982) ("Glyloid Technical Bulletin") discloses background information on the characteristics and use of tamrind seed gum.

Physiological Effects of Food Carbohydrates, American Chemical Society Symposium Series No. 15, Jeanes, A. and Hodge, J., Editors, ACS, Washington, D. C. (1975) ("Jeanes and Hodge") discloses background information on the digestibility and metabolism of the food gums employed by Applicants herein in the preparation of bulking agents. Likewise, the three references (authored by Shiau and Salyers) listed on page 3 of Applicants' PTO-1449 form submitted herewith, provide information on the physiological effects of the heteropolysaccharides employed by Applicants herein. These three articles are directed to metabolism of these heteropolysaccharides in the lower intestine by microbial flora.

The articles listed on page 2 of Applicants' PTO-1449 form (authored by Layton and Beereboom) provides background information on the state of the art in low calorie food bulking agents.

The disclosure of the above references does not constitute an admission that they are relevant or material to the claims or are "prior art" to the subject application. The citation of them is not to be construed as a representation that no better art exists or that a search has been made, they are cited merely as constituting collectively the closest art of which the Applicants are aware.

Respectfully submitted,

Mary E. Porter, Reg. Patent Attorney
